

WICKED FOR GOOD

IN THEATERS NOVEMBER 21

JOIN ELPHABA AND PROTECT OUR WILDLIFE

Elphaba stands up for the Animals in Oz, and we can stand with her by getting involved with organizations such as Re:wild to ensure wildlife thrives in our world, too. Animals play such a vital role in our ecosystem, and you have the power to help protect and support them.

DID YOU KNOW?

Wildlife sustains us.

From bees that pollinate crops to the blue whales in the oceans, every species plays an important role in keeping nature – and us – healthy.

Wildlife is in crisis.

Nearly 1 million species are at risk of extinction because of habitat loss, overexploitation, pollution and changing climates. When species disappear, so do the systems that give us food, clean water, and even the air we breathe.

Wildlife alerts us.

Keystone species, such as sharks, bats and amphibians, play an essential role in maintaining healthy ecosystems. Among them, amphibians are often overlooked, but their sensitivity to small changes in their environment makes them important bellwethers for ecosystems that may be in trouble – and 41 percent of amphibians are now threatened with extinction.

Conservation works.

Thanks to global efforts, species such as the giant panda, bald eagle, humpback whale, and Nepal tiger, have come back from the brink of extinction.

Conservation works and is a critical step to protecting the health of our planet.

HOW YOU CAN HELP

Help Save Wildlife

Your **donation**, no matter the size, can help our planet's most vital ecosystems and recovering threatened wildlife, from amphibians to monkeys to sharks.

Search for Lost Species

Join Re:wild's "Search for Lost Species," and share stories of "missing" species, from giant bees to rare birds, to inspire global support for protecting biodiversity.

Protect Threatened Amphibians

Let's make sure our wild friends stay safe. There are **many ways to help**, but a few include shopping with forests in mind (buying products with FSC-certification or made with RSPO certified palm oil), eliminating insecticides and pesticides from your yard, and leaving amphibians, like frogs, alone if you come across them in the wild. Salamanders are especially vulnerable; they breathe through their skin and touching them can cause harm.

Make Your Yard a Wildlife Corridor

Create a safe stopover for migrating animals by adding native plants and water features to your yard. Bird or bat boxes, or hedgehog hostels can support both migratory and local species. And if you think bats are scary – think again! Though it's important to keep a safe distance from them, bats are in fact gentle, sociable mammals that play an important role in controlling pests, pollinating plants, and dispersing seeds.
